

Scorr

HR KPI & Rewards Platform

Complete Project Documentation

Live: <https://scorr.walfia.ai>

Repository: github.com/usmanHassanzai/HR

Generated: 19 June 2026

1. Project Overview

Scorr is a role-based HR performance and rewards web application. Managers assign KPI tasks with deadlines; employees complete them; the system calculates health scores, awards monthly points, and lets employees redeem rewards that managers approve.

1.1 User Roles

Admin	User directory, reports (PDF/Excel/CSV), analytics, branding, rewards catalog, monthly points job
Manager	Team leaderboard, KPI assignment, team reward approvals, own KPIs and points
Employee	KPI dashboard, mark tasks complete, rewards and points, notifications

1.2 Core Workflow

- Manager assigns KPI (employee, department, dates) via KPI Config
- Employee marks KPI complete before deadline
- Overdue KPIs trigger notifications and email via Resend
 - 3 missed deadlines = " 300 points penalty
- End of month: Admin runs Monthly Points Job
 - Employee redeems catalog reward !' Manager approves !' Fulfilled

2. Technology Stack

2.1 Frontend

React	19.2.6 — UI library
TypeScript	6.x — type-safe JavaScript
Vite	8.x — build tool and dev server
CSS	Vanilla CSS design system (index.css)
Lucide React	Icons throughout the UI
Supabase JS	@supabase/supabase-js 2.x — API client
jsPDF	Client-side PDF export for KPI reports
SheetJS (xlsx)	Excel export for admin reports
Capacitor 8	Optional native Android/iOS wrapper (PWA)
PWA	manifest.webmanifest + service worker (sw.js)

2.2 Backend (Supabase)

Supabase Auth	Email/password login, JWT sessions
PostgreSQL	Managed database (Supabase hosted)
Row Level Security	Role-based data access on all tables
SQL RPCs	Server functions: assign_kpi_manager, complete_kpi_employee, calculate_monthly_points, etc.
Realtime	Live KPI and notification subscriptions
Edge Functions	Deno serverless: kpi_email, export_report, auto_score, ai_narrative, monthly_target

2.3 Database Tables

- users — profiles linked to auth.users (role, manager, health_score)
- kpis — assigned tasks, status, dates, completion, AI narrative
- kpi_submissions — historical KPI value submissions
- tasks — employee task list
- notifications — in-app alerts (info, alert, escalation, reminder)
- points_ledger — monthly points earned per employee (never expire)
- rewards_catalog — redeemable rewards (name, cost, icon)
- reward_redemptions — redemption workflow (pending !' approved !' fulfilled)

2.4 DevOps & Infrastructure

GitHub	Source code: usmanHassanzai/HR
Vercel	Production hosting, CI/CD, SSL, custom domain
GoDaddy	DNS for walfia.ai domain
Resend	Transactional email API
who.is	DNS lookup tool (diagnostic only, not production)

3. Domain & DNS

3.1 Domains Used

Main domain	walfia.ai — registered and managed on GoDaddy
App URL	scorr.walfia.ai — where Scorr is live
Vercel URL	hr-walfia.vercel.app — default Vercel deployment URL
Email from	noreply@scorr.walfia.ai — verified in Resend

3.2 Why scorr.walfia.ai (subdomain)?

- Matches Scorr branding and email domain
- Leaves walfia.ai available for a future company homepage
- Standard pattern: app.company.com

3.3 DNS Configuration (GoDaddy)

Type	CNAME
Name / Host	scorr
Value / Points to	cname.vercel-dns.com
TTL	1 Hour (default)

Vercel project "hr" !' Settings !' Domains !' scorr.walfia.ai added. SSL is auto

4. Why We Used Each Service

Vercel — Frontend Hosting

Hosts the static React build (dist/). Connects to GitHub for automatic deploys on push. Provides free SSL, CDN, and environment variables for Supabase keys. Build: npm run build !' output

GoDaddy — Domain & DNS

You own walfia.ai on GoDaddy. DNS records (CNAME) tell browsers that scorrr.walfia.ai should reach Vercel servers. GoDaddy does NOT host the application code — only domain routing.

who.is — DNS Lookup (one-time tool)

Used during setup to verify who controls walfia.ai DNS (showed GoDaddy nameservers: domaincontrol.com). Not part of the running application — only for troubleshooting.

Supabase — Backend Platform

All-in-one backend: authentication, PostgreSQL database, REST/Realtime API, Row Level Security, and Edge Functions. Project ref: yvnbxweitelowucdhwpq. Site URL configured to https://scorrr.walfia.ai.

Resend — Email Delivery

Sends KPI notification emails (overdue, completed). Domain scorrr.walfia.ai verified in Resend. API key stored in Supabase Edge Function secrets — NOT in Vercel or GitHub. Edge function: supabase/functions/kpi_email/.

GitHub — Version Control

Stores all source code. Vercel watches the main branch and redeploys on every push.

5. Rewards & Points System

5.1 Monthly Performance Tiers (points never expire)

KPI Score "e 90 %	+1,000 points
KPI Score 80–89%	+500 points
KPI Score 70–79%	+250 points
KPI Score < 70%	0 points

5.2 Redemption

- Catalog items cost 1,000 points each (Team Dinner, Movie Tickets, Half-Day Leave, Gift Voucher)
- Employee redeems !' status pending !' Manager approves !' fulfilled
- Admin can override org-wide in Rewards tab

5.3 Penalties

- 3 missed KPI deadlines = " 300 points (via check_overdue_kpis RPC)

6. Environment Variables

6.1 Vercel (Production frontend only)

VITE_SUPABASE_URL	https://yvnbxweitelowucdhwpq.supabase.co
VITE_SUPABASE_ANON_KEY	Supabase public anon key (safe for browser)

6.2 Local .env (never commit to GitHub)

VITE_SUPABASE_URL	Supabase project URL
-------------------	----------------------

VITE_SUPABASE_ANON_KEY	Anon key
SUPABASE_SERVICE_ROLE_KEY	Server-only — scripts only
SUPABASE_PAT	Supabase personal access token for scripts
RESEND_API_KEY	For deploy-kpi-email.mjs
KPI_EMAIL_FROM	Scorr <noreply@scorr.walfia.ai>

7. Key Files & Folders

- src/components/ — React UI (AdminDashboard, ManagerDashboard, EmployeeDashboard, etc.)
- src/lib/supabase.ts — Supabase client configuration
- src/utils/ — Helpers (KPI, export, email, rewards tiers)
- supabase/schema.sql — Full database schema, RLS, RPCs, triggers
- supabase/seed.sql — Demo users and sample data
- supabase/functions/ — Edge functions (kpi_email, export_report, etc.)
- scripts/ — setup-db, deploy-production, migrations
- vercel.json — SPA routing and cache headers
- public/ — Static assets, PWA manifest, logos

8. Demo Accounts & Deployment

8.1 Demo Logins

Admin	admin@walfia.ai / admin123
Manager	manager@walfia.ai / manager123
Employee	employee@walfia.ai / employee123

8.2 Deployment Steps

- 1. Push code to GitHub (main branch)
- 2. Vercel auto-builds and deploys
- 3. GoDaddy CNAME: `scorr!cname.vercel-dns.com`
- 4. Supabase Auth URL = `https://scorr.walfia.ai`
- 5. Resend domain verified for `scorr.walfia.ai`

8.3 Useful Commands

- `npm run dev` — local development
- `npm run build` — production build
- `node scripts/setup-db.mjs` — initialize database
- `node scripts/update-rewards-tiers.mjs` — apply rewards SQL
- `node scripts/deploy-kpi-email.mjs` — deploy email function
- `node scripts/generate-project-doc-pdf.mjs` — regenerate this PDF
